PanGreen™ Universal SYBR Green Mastermix UNG PanGreen™ Universal SYBR Green Mastermix UNG w High ROX PanGreen™ Universal SYBR Green Mastermix UNG w Low ROX

Catalog Number	Size	Concentration
QSD02-0100	100 reactions (20 μ l vol)/40 reactions (50 μ l vol)	2X
QSD02-H100	100 reactions (20 μ l vol)/40 reactions (50 μ l vol)	2X
QSD02-L100	100 reactions (20 μ l vol)/40 reactions (50 μ l vol)	2X

Storage Conditions

Stable for up to 24 months at -20°C.

Description

This product is a new contamination-proof, dye-based real-time PCR master mix developed, based on PanGreen™ Universal MasterMix (Cat. QSD01-0100), by adding an optimized ratio of dUTP and UNG enzymes. It contains optimized concentrations of the Hotstart DNA polymerase, SYBR Green I, dNTPs, dUTP, UNG enzyme (Uracil DNA glycosylase), Mg²+, reaction buffer, and stabilizer. In the PCR reaction, dUTP is used instead of dTTP, and the T in the amplification product fragment is replaced by the U to form a PCR amplification product containing dU bases, and the highly active UNG enzyme can quickly degrade the U-containing DNA fragment in the reaction system, effectively eliminating the residual contamination of PCR products in the environment and greatly reducing the false positive caused by the amplification product contamination, thus ensuring the specificity and accuracy of the amplification. This product is a 2×contamination-proof, chemically modified real-time PCR premix reaction system, only requiring to add the template, primers, ROX Reference Dye (for calibrating the fluorescence signal error generated between wells and used according to different real-time PCR instruments) and water to make its working concentration 1× for carrying out the reaction. It has the advantages of rapidness and simplicity, high sensitivity, strong specificity, and good stability, which can minimize the human error, save PCR experimental operation time, and reduce the probability of contamination.

Kit Content(s)

QPD02-0100	2X Universal SYBR® Green Master Mix (UNG)	1 ml x 1 vial
QPD02-H100	2X Universal SYBR® Green Master Mix (UNG)	1 ml x 1 vial
	High ROX Reference Dye	40 μl x 1 vial
QPD02-L100	2X Universal SYBR® Green Master Mix (UNG)	1 ml x 1 vial
	Low ROX Reference Dye	40 μl x 1 vial

- A compatible real-time PCR instrument
- Vortex or equivalent
- Microcentrifuge
- Plates and seals for your instruments

Instrument Compatibility

Instrument	ROX	
ABI Prism7000/7300/7700/7900HT, ABI Step One,	High ROX reference dye	
ABI Step One Plus		
ABI Prism 7500/7500 Fast, MJ Research Chromo4,	Low POV reference dvo	
Option (II), Corbett Rotor Gene 3000	Low ROX reference dye	
Thermal Cycler Dice Real Time System,		
LightCycler, Smart Cycler System, Corbett Rotor-	Without ROX reference dye needed	
gene 6000, Agilent Technologies Mx3000P		

Reaction Setup

- 1 Thaw PanGreen™ Universal SYBR® Green Master Mix (UNG) and the rest of the frozen reaction components to a temperature of 4°C. To entirely collect solutions, combine thoroughly and centrifuge briefly, then store at 4°C and avoid light.
- 2 Prepare (on ice or at room temperature) enough assay Master Mix for all reactions by adding all necessary components, except the DNA template, according to the recommendations in the table below.

_	Volume per 20 μl Reaction			Volume per 50 μl Reaction		
Components	QSD02-0100	QSD02-H100	QSD02-L100	QSD02-0100	QSD02-H100	QSD02-L100
2X Universal SYBR® Green Master Mix (UNG)	10 μΙ		25 μΙ			
Forward primer ^a	0.5 μΙ			1 μΙ		
Reverse primer ^a	0.5 μΙ		1 μΙ			
DNA template ^b	1 μΙ		1 μΙ			
High ROX Reference Dye ^c	-	0.4 μΙ	-	-	1μΙ	-
Low ROX Reference Dye ^c	2 810	-	0.4 μΙ	-	-	1 μΙ
Nuclease-free H ₂ O	Add to 20 μl				Add to 50 μl	
Total reaction mix volume	20 μΙ		20 μΙ			

Primer concentration: Typically, optimal results are achieved with a primer concentration of 0.2 µM, with a suggested range of 0.1–1.0 µM.

Adjustments can be made to the primer concentration to enhance amplification efficiency or mitigate nonspecific reactions. To achieve ideal qPCR outcomes, aim for amplification fragments ranging from 80 to 200 bp in length.

^b Template: Use 0-100 ng of genomic DNA or 1-10 ng of cDNA as a reference. Due to variations in the copy numbers of target genes among different species, gradient dilutions of the template can be performed to determine the optimal amount for usage. Additionally, when using cDNA from Two-step RT-PCR reactions as a template, ensure that the amount added does not exceed 10% of the total volume of the PCR reaction mixture.

^c ROX Reference Dye requirement varies among different instruments, and its addition may be necessary or unnecessary. Please consult the instrument manual for specific instructions.

3 Combine the assay Master Mix thoroughly to ensure consistency and equally dispense the solution into each qPCR tube or into the wells of a qPCR plate. Employ good pipetting practice to ensure assay precision and accuracy.

Note: to ensure thorough mixing of reaction components, vortex for approximately 30 seconds (or more).

- 4 Spin the tubes or plate to remove any air bubbles and collect the reaction mixture in the vessel bottom.
- 5 Setup the thermal cycling protocol on a real-time PCR instrument according to Step 5.1 and 5.2.

Note: optimization may be needed for better performance.

Thermal Cycling Protocol

Starting with a two-step PCR reaction protocol is recommended, and if it doesn't yield satisfactory results, PCR conditions can be optimized. In situations where the amplification performance of the two-step PCR reaction is subpar, possibly due to factors like the use of primers with lower Tm values or longer amplification fragments, transitioning to a three-step PCR amplification reaction can be considered.

5.1 Two-step reaction setting

Procedure	Time and Temperature			
UNG enzyme treatment	5 minutes at 50°C			1
Initial Denaturation	10 minutes at 95°C			
Denaturation	15 seconds at 95°C	3	40 avalos	
Annealing- Extension	1 minutes at 60°C		40 cycles	

Melting curve

5.2 Three-step reaction setting

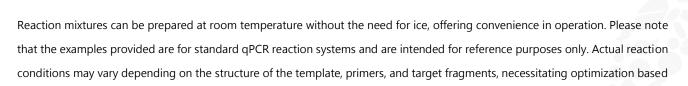

Time and Temperature
5 minutes at 50°C
10 minutes at 95°C
15 seconds at 95°C
30 seconds at 60°C 40 cycles
30 seconds at 72°C

Melting curve

Note: The Hotstart DNA Polymerase utilized in this product is chemically modified to better suppress background activity, remaining inactive at temperatures below 75°C. This effectively prevents nonspecific amplification resulting from primer-template nonspecific binding or primer dimer formation at room temperature. Activation of the enzyme requires incubation at 95°C for 10 minutes.

Protocol

6 Load the PCR tubes or plate into the real-time PCR instrument and commence the run.

on their characteristics. Adjustments to the reaction system should be made accordingly.

7 Perform data analysis according to the instrument-specific instructions.

Template

Purified high-quality DNA is needed for a successful PCR reaction. For the final concentration of cDNA template please refer to the table in Reaction Setup.

Important notes

- 1. Shake gently before use to avoid foaming and low-speed centrifugation.
- 2. During operation, always wear a lab coat, disposable gloves, and protective equipment.
- 3. The ROX reference dye keeps away from light.

Troubleshooting

Refer to Table 1 below to troubleshoot problems that you may encounter when quantifying of nucleic acid targets with the kit.

Table 1. Troubleshooting				
Trouble	Cause	Solution		
	Inhibitor Present	 Perform a dilution series of the PCR template to determine whether the effect of the inhibitory agent can be reduced. Take extra care with the nucleic acid extraction steps to minimize carryover of PCR inhibitors. 		
Poor Signal or No Signal	Degraded Template Material	 Do not store diluted templates in water or at low concentrations. Check the integrity of template material by automated or manual gel electrophoresis. 		
	Inadequate Thermal Cycling Conditions	Try using a minimum extension time of 30 sec for genomic DNA and 15 sec for cDNA.		

Signal in Negative Control		1. To minimize the possibility of contamination of PCR components by
	Contamination	PCR product or other template, designate a work area exclusively for
	of Reaction	PCR assay setup.
	Components	2. Use a solution of 10% bleach instead of ethanol to prepare the
	with Target	workstation area for PCR assay setup. Ethanol will only induce
	Sequence	precipitation of DNA in your work area, while the 10% bleach solution
		will hydrolyze, as well as dissolve, any residual DNA.
		1. Perform a dilution series of the PCR template to determine whether
Poor	Inhibitor	the effect of the inhibitory agent can be reduced.
Reproducibility	Present	2. Take extra care with the nucleic acid extraction steps to minimize
Across Replicate		carryover of PCR inhibitors.
Samples	Primer Design	Verify primers design at different annealing temperatures.
		Reduce primer concentration.
		2. Evaluate primer sequences for complementarity and secondary
Low or High	Primer- Dimer	structure. Redesign primers if necessary.
Reaction		2. Perform melt-curve analysis to determine if primer-dimers are
Efficiency		present.
	Insufficient	3. Use a thermal gradient to identify the optimal thermal cycling
	Optimization	conditions for a specific primer set.
